precursor

small tRNAs

Yong Sun Lee et al. Genes Dev. 2009;23:2639-2649

challenges

- * isomiRs detection
- * small RNAs coming from multiple precursors over the genome (**multi-mapped reads can be 40% of the data.**)
- * differentiate degradation and functional molecules
- * non-model organism

seqcluster

The diagram illustrates a 'meta-cluster' containing two distinct clusters of multi-mapped reads. Each cluster is represented by a group of four blue horizontal lines (multi-mapped reads) positioned above a single grey horizontal line (unique read). The top cluster is labeled 'cluster at position 1' and the bottom cluster is labeled 'cluster at position 2'. The entire diagram is enclosed in a black rectangular border.

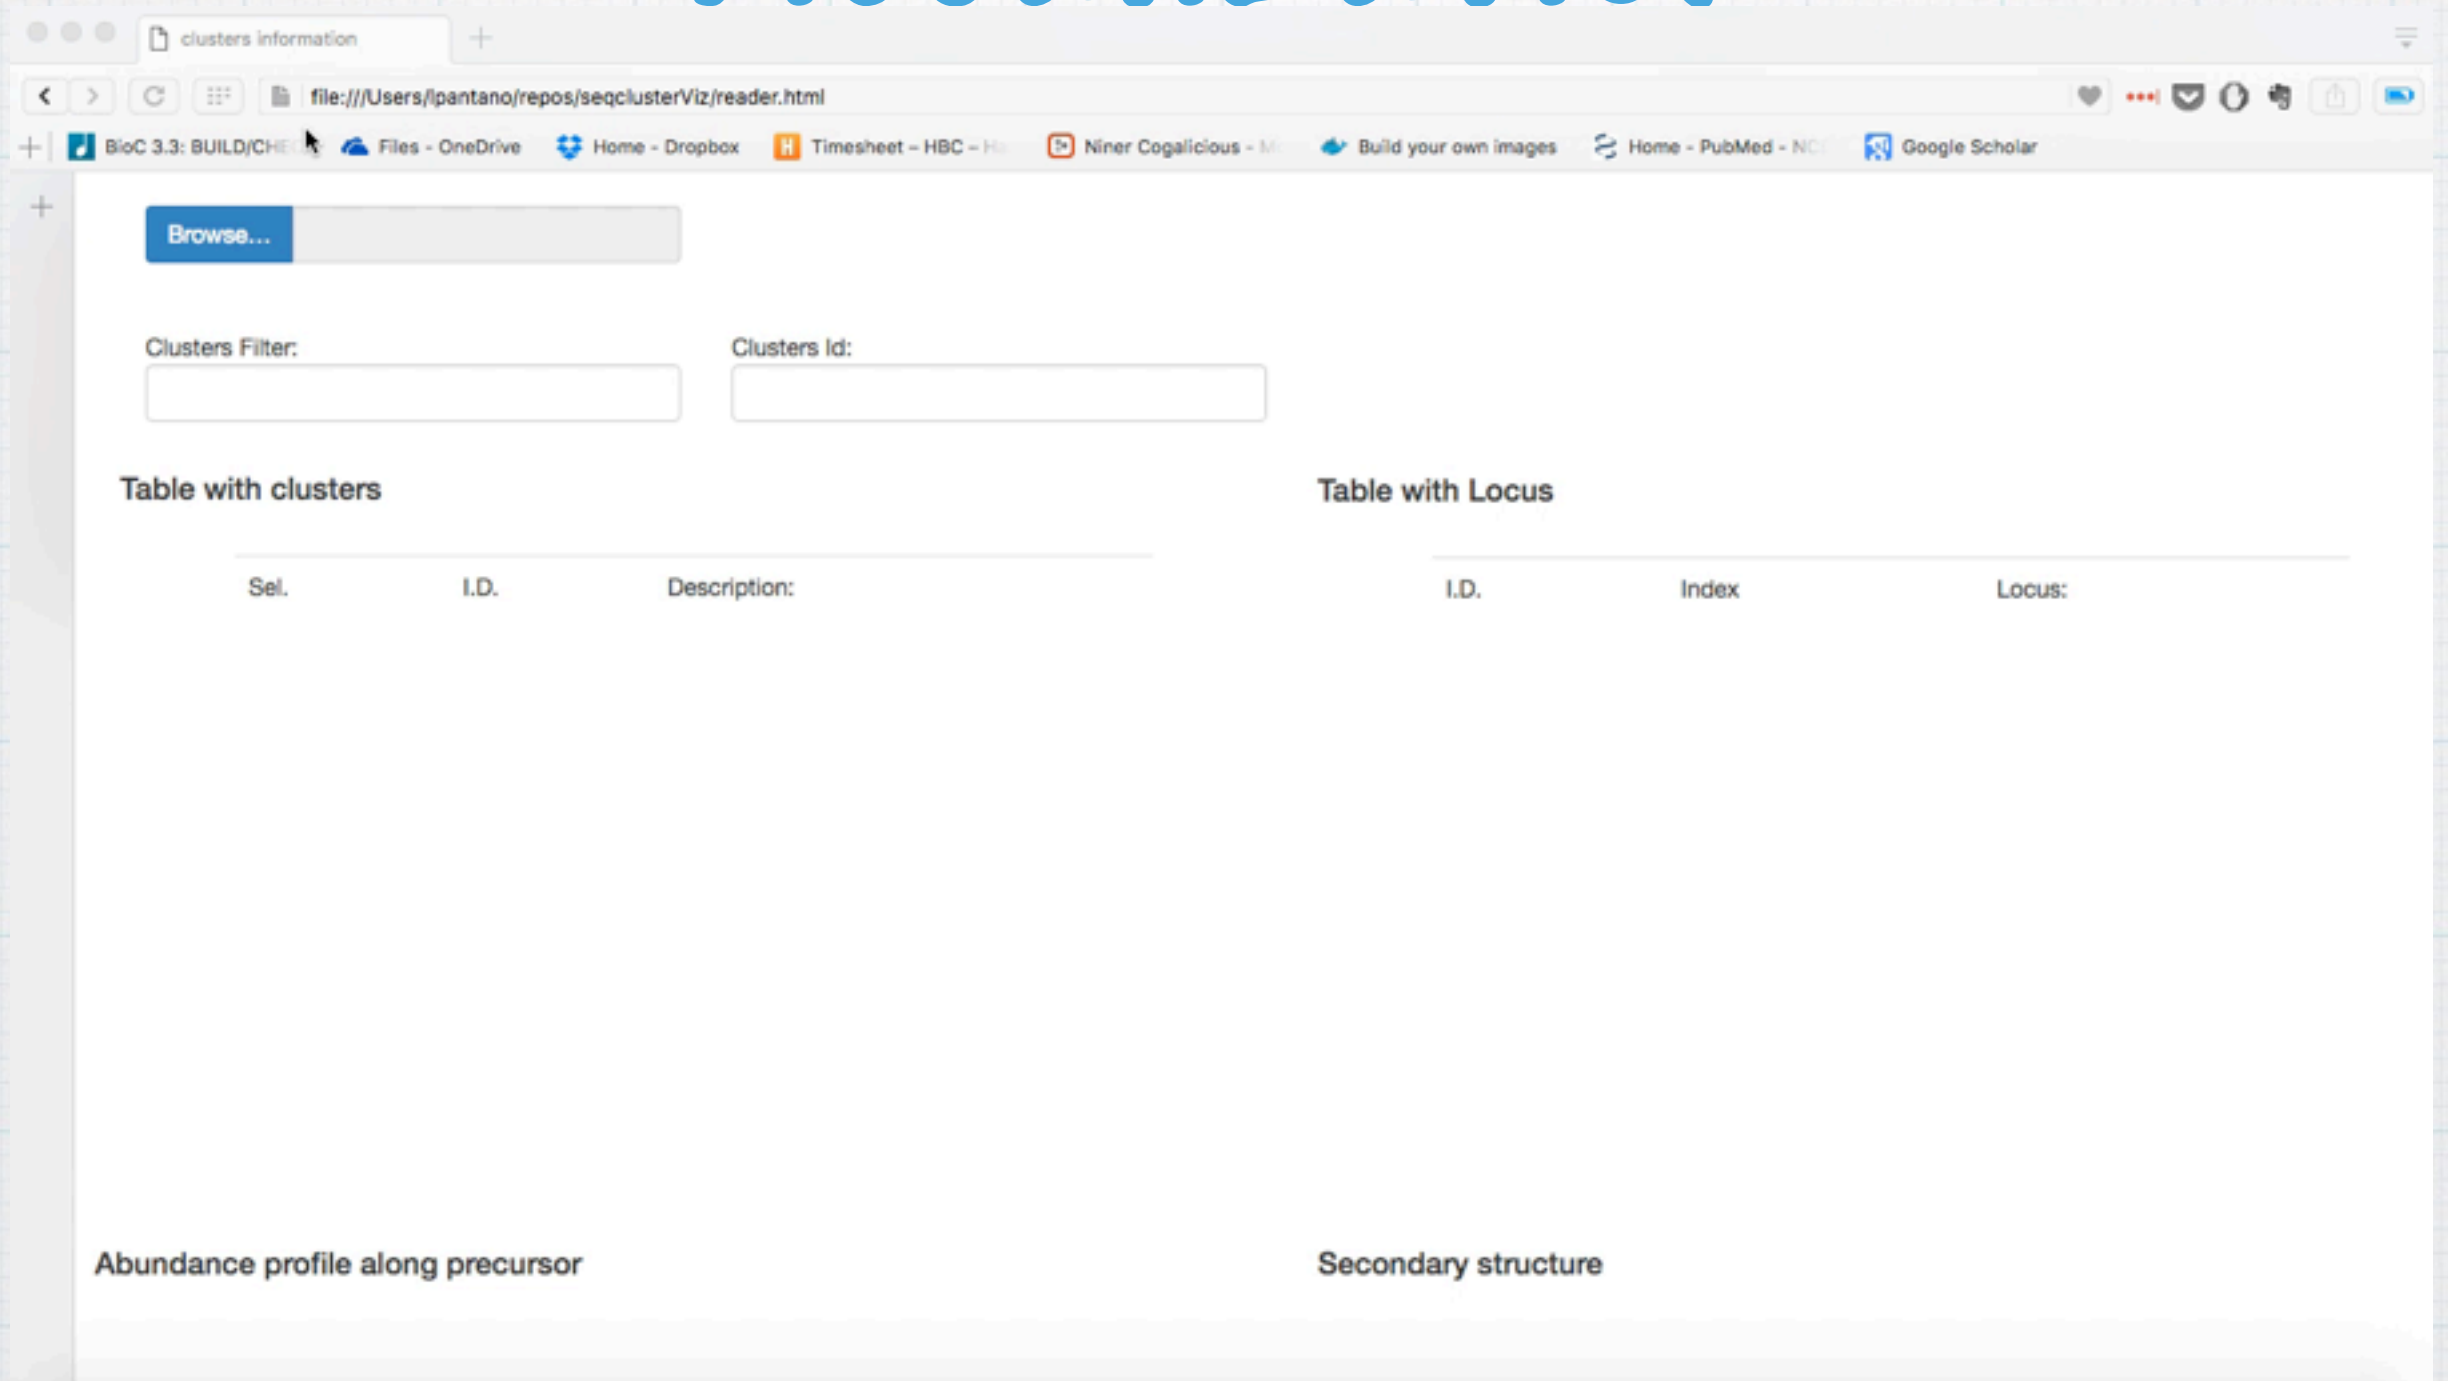

cluster at position 1

cluster at position 2

Quality Control samples

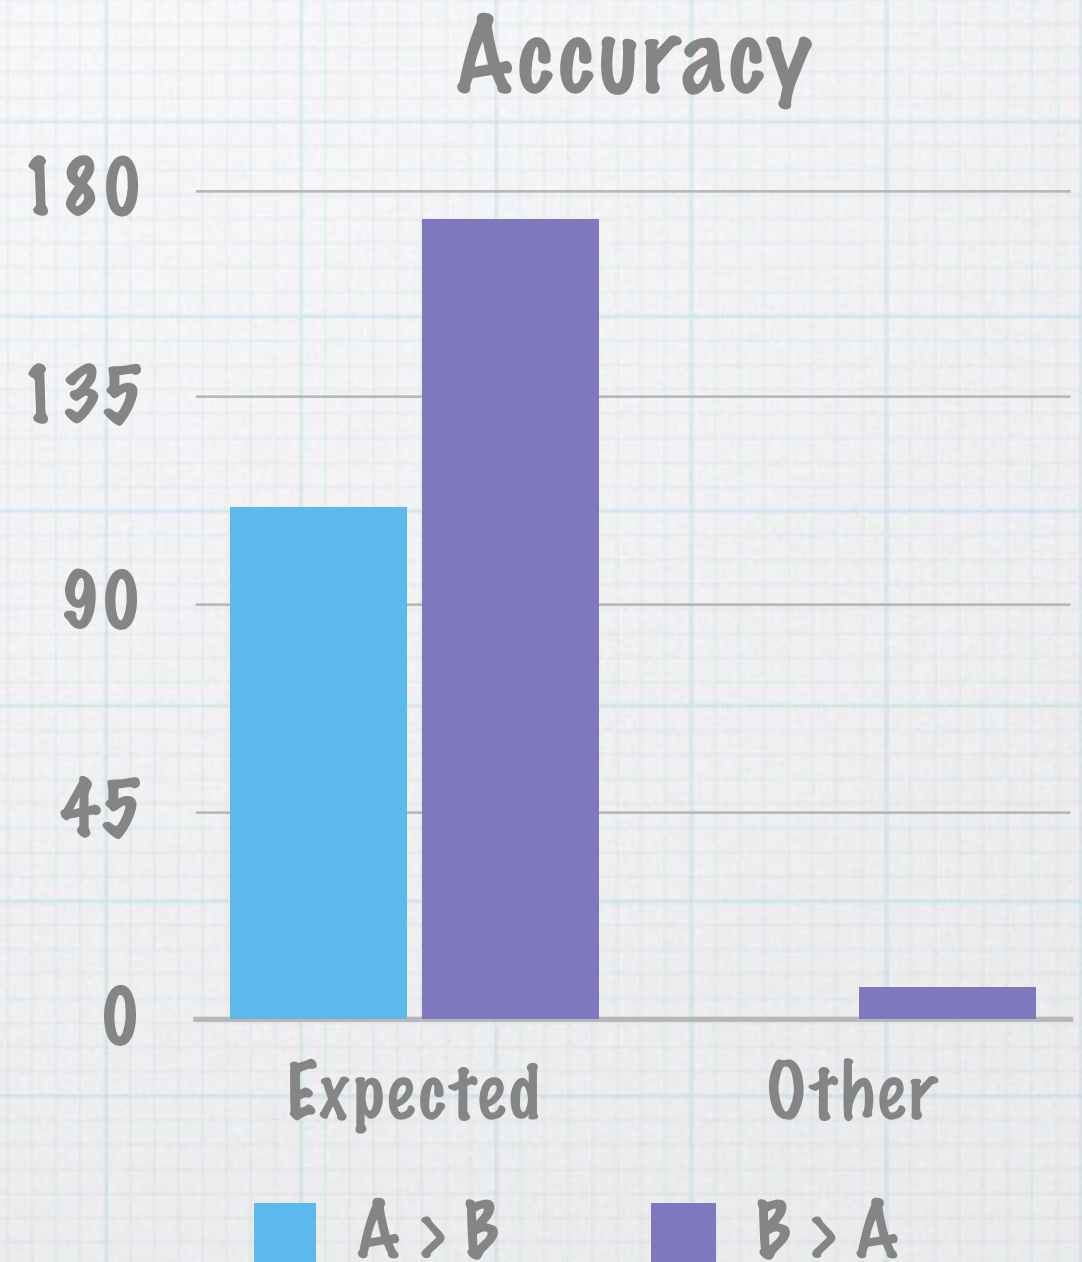

For each molecule:

- * If $A > B$ then $A > D > C > B$
- * If $B > A$ then $A < D < C < B$

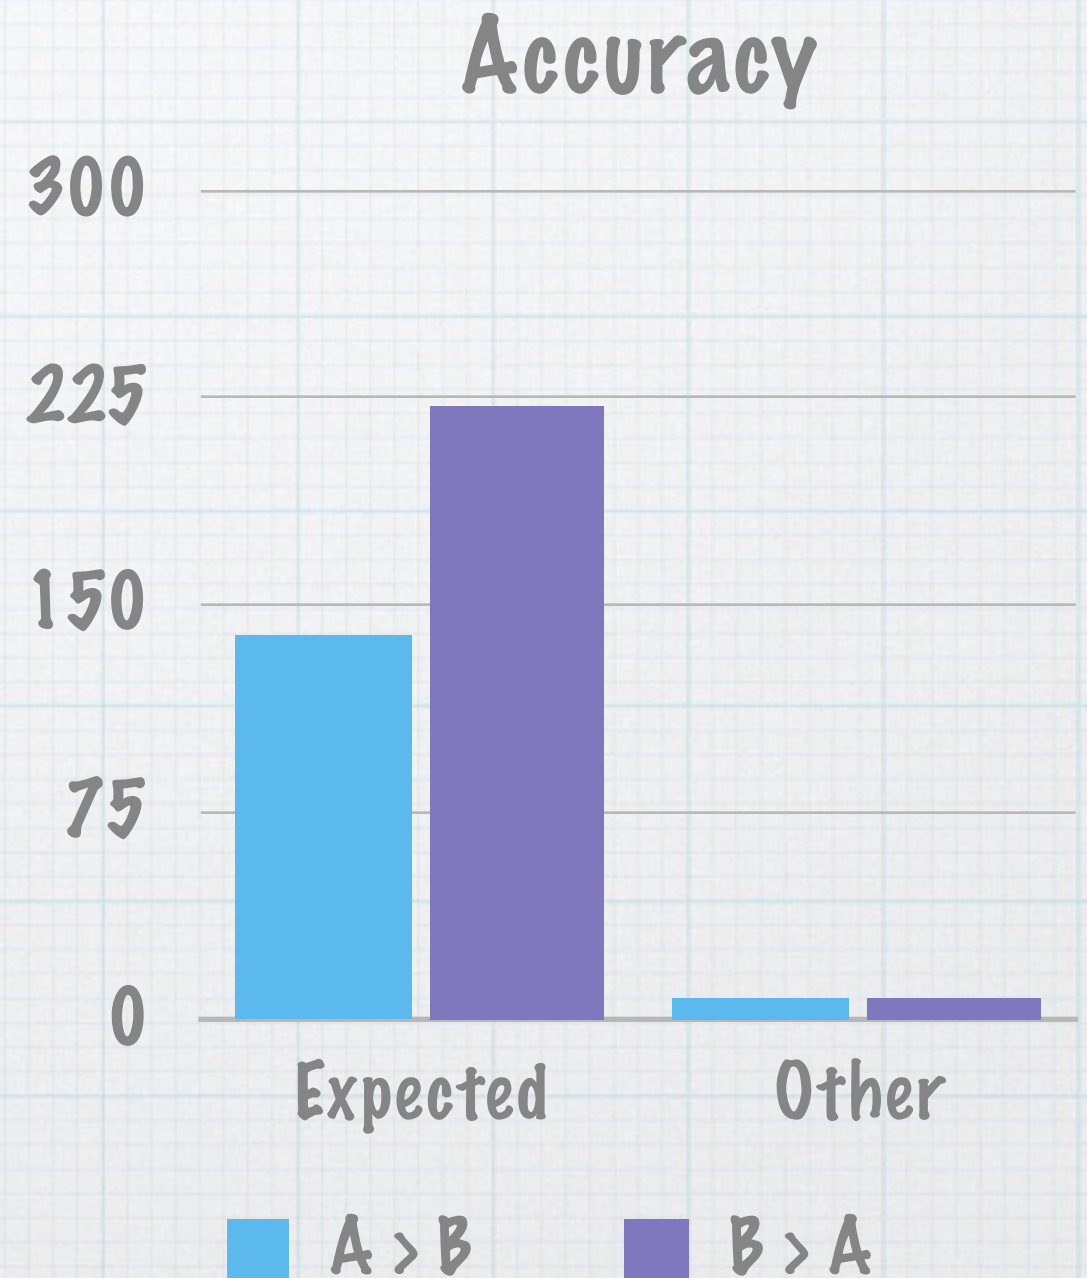

miRNA quantification

miRNAs > 5 counts in average
upper quantile normalization

clusters quantification

expression > 5 counts in average
upper quantile normalization

Resources

| | Time (h) |
|--------------------|----------|
| organize | 0:01 |
| adapter | 0:27 |
| alignment | 0:26 |
| annotation | 3:43 |
| cluster + mirdeep2 | 4:15 |
| qc | 0:04 |

The time for 8 samples with 6 millions reads each was 8 hours and 57 minutes.
